FIRE
DANGER**

Notifications

The Notifications feature permits notifications for:

- All incoming EAS messages, or EAS messages that fall into specific parameters
- All incoming priority-level text messages, or priority-level text messages that fall into specific parameters
- Outgoing EAS and priority-level text messages
 - Error notifications

Notifications

These messages and events may be disseminated in multiple ways:

- Messages may be automatically printed from a single printer, or multiple printers
- Messages may be forwarded to any email address, including standard email accounts, pagers, cell phones, etc.
(This feature requires a local mail server to disseminate email. It also permits importing existing lists of email addresses. You may select different alerts to be sent to different email addresses.)
- Messages may be decrypted into text or EDXL format, and stored in a folder on the PC for further use
- The system may be configured to launch an executable when a message arrives.

You have completed the EMnet Notifications Tutorial
