Note: The basis for this algorithm and the percentages in the meal multipliers are the experience in Florida during the 2004 and 2005 hurricane season. This calculation is made prior to landfall using census data and the graphical portrayal of the counties affected using the HURREVAC software. Some subjective judgment is required in determining the percentage of a county affected by a particular storm category.

The value of this calculation is greatest in a large event and is directed at determining if/when Red Cross/Salvation Army mass care resources are/will be exhausted. If the calculation shows that the mass care resources of the voluntary agencies are exceeded then state and federal resources must be allocated to this task.
